I OBJECTIVE

The objective of the RV Reliability, Enhancement, and Evaluation Task is to develop techniques to enhance remote viewing (RV), both to enhance the potential for applications,

II INTRODUCTION

Carlo Maria

SRI International is tasked with assessing the potential of RV for applications.* In this task, as defined for fiscal years (FY) 1981 through 1983, special emphasis is placed on the possibility that enhancement techniques can be developed that will significantly increase levels of accuracy and reliability.

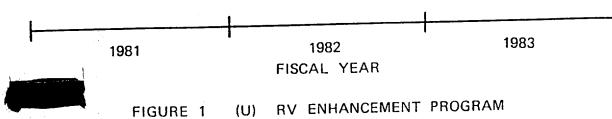

The three-year effort focuses on (1) the development of techniques to enhance the accuracy and reliability of RV, (2) the application of RV, (3) the evaluation of such techniques and applications, and (4) the integration of RV.

The apportionment of these efforts over the three-year period is shown in Figure 1.

Investigation of the RV phenomenon at SRI International over the past decade has ranged from basic research for proof or the lack of proof of the existence of the phenomenon to applications in which the existence of the phenomenon is assumed. The present study emphasizing applicability is the latter type—proof of the phenomenon is not explicitly pursued here. Some pragmatic measure of demonstration of existence is provided, however, by assessment of the quality of results obtained in tests carried out under double-blind conditions.

In this report we discuss the effort for FY'81. This effort consisted of:

RV is the acquisition and description, by mental means, of information blocked from ordinary perception by distance or shielding.

- (1) The development of a six-stage RV training procedure, which we hypothesized would lead to improved RV performance.
- (2) The beginning of orientation/application/testing of the procedure with four experienced and one novice remote viewer.
- (3) The generation of data by the experienced remote viewers
- (4) The development of a first-generation series of evaluation sheets (and an associated computerized data-base management system) for use by analysts in providing numerical estimates of various aspects of the RV product.

III RV ENHANCEMENT TASK

A. Tasking

SRI International is tasked with working toward the development of RV enhancement procedures

Of

particular interest are the development of procedures that can be transmitted to others in a structured fashion (i.e., "training" procedures), and that can be used in targeting on distant sites

B. Coordinate RV (CRV)

One targeting procedure, which we have been investigating at SRI since 1972, is an abstract procedure known as "coordinate remote viewing (CRV)." In this procedure, the target site coordinates (latitude and longitude in degrees, minutes, and seconds) are given (with no further information) to the individual who is to view the site. The remote viewer is then asked simply to proceed on the basis of the coordinates alone.*

Admittedly, such an abstract targeting procedure seems without basis, at least with regard to the present scientific paradigm. As a result we can make no claim for the technique other than the purely pragmatic one that it appears to work. It can only be pointed out that the possibility of success in such a protocol is in accord with an observed "goaloriented" nature of the laws that appear to govern such functioning. An investigation into the general problem of target acquisition has been carried out and reported in R. Targ, H. Puthoff, B. Humphrey, and C. Tart, "Investigations of Target Acquisition," Research in Parapsychology, 1979 (Scarecrow Press, Inc., Metuchen, N.J., 1980).

Approved For Release 2000/08/07 : CIA-RDP96-00788r001300280002-7

C. Overview of the RV Enhancement Procedure

Specifically under investigation at the present time is an RV enhancement procedure developed by I. Swann, an SRI consultant. The procedure focuses on improving reliability of remote viewing by controlling those factors that tend to introduce noise into the RV product. Following is a summary overview of the Swann CRV procedure. A detailed historical and technical summary is being prepared as a separate technical report.

Two major sources of noise have been found: (1) noise caused by factors in the environment of the remote viewer, and (2) noise arising within the viewer as a result of cognitive processes (analysis/interpretation).

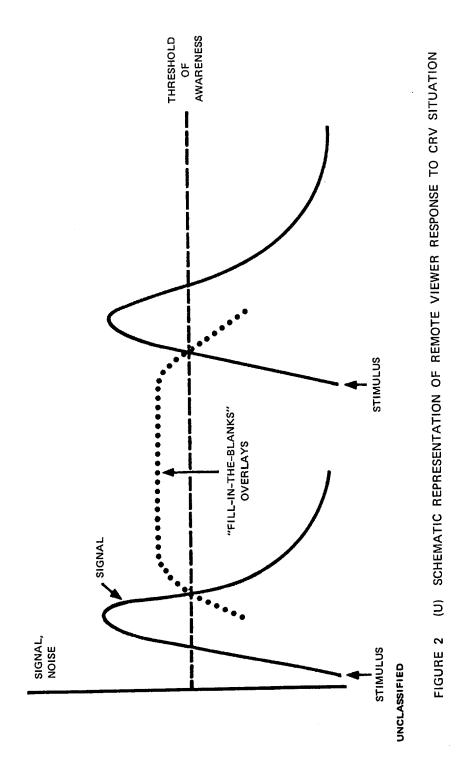

Noise from the environment, peripheral visual clutter or sounds in the environment (even subliminal) can intrude on perceptual and thought processes and degrade the RV response. Actions or statements by the session monitor can similarly distract the remote viewer.

"Internally generated" noise seems to be produced in the remote viewer himself. With the application of a "stimulus" (e.g., the reading of a coordinate) a momentary burst of "signal" appears to enter into awareness for a few seconds and then fade away. At this point memory and imagination appear to fill in the void, thus producing "noise" in the RV product. This effect is presumably produced by a need to resolve the ambiguity associated with the fragmentary nature of emerging perceptions. (This relationship is schematically diagrammed in Figure 2.) To prevent this effect disciplined rejection of premature interpretations and conclusions is necessary.

The techniques designed to handle these noise problems involve

(1) repeated coordinate presentation and quick-reaction response on the
part of the remote viewer to minimize the imaginative overlays, (2) the
use of a specially designed, acoustic-tiled, featureless room with

Approved For Release 2000/08/07 : CIA-RDP96-00788r001300280002-7 **UNCLASSIFIED**

homogeneous coloring, to minimize environmental overlay, and (3) the adoption of a strictly prescribed, limited monitor behavior to minimize monitor overlay.

The training protocol as presently structured proceeds through a series of six stages of proficiency, hypothesized to correspond to six stages of increasing contact with the target site. These are outlined in Table 1.

Table 1
STAGES IN REMOTE VIEWING

Stage	Example Example
(1) Major gestalt (2) Sensory contact	Land surrounded by water, an island Cold sensation, wind-swept feeling
(3) Dimension, motion, mobility	Rising up, a panoramic view Three large buildings, clustered together as a facility.
(5) Special qualitative aspects(6) Significant analytical aspe	1 Tive organisms

During FY 1981, Swann worked on developing the details of the six-stage RV enhancement procedure under investigation by serving as a remote viewer himself for over 200 training trials for sites from around the globe. Coordinates for site acquisition and data for feedback and analysis were obtained from National Geographic, World Aeronautical Charts, USGS topographical maps and the like. To indicate the range and type of sites employed, a representative sample of sites used in CRV practice from November 1980 are listed in Appendix A.

Approved For Release 2000/08/07 : CIA, RDP96-00788r001300280002-7

D. Transfer of RV Enhancement Technology

Swann instructed three other experienced remote viewers (#009, #131, and #504) in theory classes. Application of the theory was carried out on the basis of practice RV training trials on around-the-globe sites (over 60 each) by the remote viewers. Toward the end of the FY 1981 effort, the first novice remote viewer (#622) was introduced into the training task so that we could begin to obtain data on the response of inexperienced personnel to the training program as structured. This remote viewer had over 50 RV trials.

observed the theory classes and acted as monitor for several of the practice sessions to monitor the progress of the RV enhancement program. Both also acted as monitors for RV tasks, which provided additional data on progress of the program (Section IV).

Although detailed formal evaluation of the training program is not scheduled until mid FY 1982, some general observations of progress in RV enhancement can be made. The experienced remote viewers (#009, #131, #504) were taken through Stage 3 in the theory orientation sessions, and reliable data were obtained through Stage 2 into Stage 3 in the RV training trials. The remote viewers experienced some difficulty in adjusting to this "retraining" because some of the experienced remote viewers had to modify the style which they had developed. This adoption of style did not, however, appear to interfere with their ability to perform well using the RV enhancement techniques under study.

Figure 3 is an example of what is meant by Stage 3 Remote Viewing (dimension, motion, mobility). The (blind) target site was Wotje Atoll in the Marshall Islands in the Pacific. For a good rendition an ability to "move" around the site is required to outline the shape of the island, associated reef, buildings, and so forth.

12

The novice remote viewer was given orientation through Stage 2, and has produced reliable data through Stage 1 to date. In contrast with the experienced remote viewers, the novice viewer experienced no particular difficulty in becoming familiar with the codified RV enhancement procedure.

E. Summary of the RV Enhancement Technique

The RV enhancement techniques may be summarized as follows:

- (1) The codified multistage approach to data acquisition inherent in the RV enhancement procedure appears to "slow down" the incoming data successfully, thereby providing some safeguard against the natural tendencies of the remote viewer to interpret and analyze prematurely.
- (2) The data being generated within the structure being investigated appear to result in briefer transcripts with higher signal-to-noise ratios compared to previous results. The gain appears to be both in the quality of individual trials and in the reliability from trial to trial.
- (3) Knowledge of the hypothesized multistage process of site acquisition appears to provide some predictive value about the quality of the RV product. The data that do not emerge more or less in the staged order tend to have a higher percentage of overlay.

A. RV Tasking

applied RV, both to determine the potential for application and to provide data.

In response to this requirement, SRI responding to quick-reaction requirements set by representatives monitoring the progress of the work.

B. RV Session Format

The format for carrying out these tasks during FY 1981 is as follows. A request for information is forwarded to COTR in residence at SRI. He then provides targeting information (e.g., coordinates) to an SRI RV session monitor at start of session, who then works with a remote viewer to obtain data. In this format, SRI personnel are generally blind to the source of the request and the type of site or event of interest. In many cases the COTR monitors the RV session, or even conducts the session himself.

C. Pre- and Post Task Calibration

In an effort to determine whether a remote viewer is "on-line" before attempting an task, a presession calibration trial of a site of the kind selected from the National Geographic is carried out. If the results are good, the task is engaged; if not, the task is aborted. In like fashion, a postsession calibration trial is carried out

to provide an estimate of whether the viewer remained "on-line" during the task.

Examples of pre- and post-session calibration trials for Site J.S. #17 are shown in Figures 4 and 5. In these examples the characteristics of the new technique under consideration can be noted: brevity of response from repeated coordinate presentation; physical sensations associated with the site; labeling of analytical overlays (AOL) to distinguish them from signal; and general progression through the stages.

In the case of these calibration trials accompanying Site J.S. #17, good results obtained in the calibration trials correlated well with good results on the task. Based on these kinds of results, data will be collected throughout the program to determine whether pre- and post- session calibration trials can reliably provide useful indicators for estimating the quality of data obtained in the RV task.

D. FY 1981 RV Sites

The tasks carried out during FY 1981 are listed in Table 2. Additional detailed data are provided in the Task Summary Sheets provided in Appendix B. Complete documentation (transcripts, evaluations, etc.) can be made available

An example of a RV response is given in Appendix C.

E. Evaluation of the RV Task

A first-generation series of evaluation protocols were developed for use by analysts in providing numerical estimates of various aspects of to RV product generated in RV tasks. The returned protocols constitute the basis for contractor evaluation, feedback to the remote viewer, and as input for the computerized data-base management (DBM), The evaluation protocols submitted to analysts for their completion are provided in Appendix D. A sample returned evaluation protocol (for Site J.S. #17) is included as Appendix E.

While awaiting the bulk of evaluation protocols, the contractor has begun development of a computerized data-base management system to handle this material. This system, programmed on a stand-alone LSI 11/23 system located in a project classified space, will provide a library/catalog function of data-base readout by date, site, viewer, etc., and trend analysis functions.

V SUMMARY OF THE FY 1981 RV ENHANCEMENT TASK

Progress in the FY 1981 RV Enhancement Task can be summarized as follows:

(1) Efforts completed:

- · CRV enhancement procedure developed.
 - All six stages researched
 - Over 200 CRV practice trials with Swann
 - Orientation through Stage 3 into Stages 4 and 5 completed.
- Procedure transmitted to three experienced remote viewers.
 - Over 60 CRV practice trials each
 - Orientation through Stage 3 completed
- Procedure transmitted to one novice remote viewer
 - Over 50 CRV practice trials
 - Orientation through Stage 1 completed
- Data obtained on Sites J.S. #8 through J.S. #22.
- First-generation evaluation protocols developed, distributed to malysts.

(2) Findings to date:

- Subject to formal evaluation in FY 1982, the multistage approach to RV in the procedure under evaluation appears to be successful in "slowing down" the incoming data, thereby providing some safeguard against natural tendencies toward premature interpretation and analysis on the part of the remote viewer.
- The use of pre- and post- calibration trials appears to provide useful indicators for bracketing the quality of data obtained in tasks.

Results labeled as useful are being obtained in asks, where the enhancement procedure under evaluation is being employed.

Date 24	4 April 1981; 0835 hrs
Series	
Session No	
Target No	J.S. #19
Target	
Remote Viewer	#009
Interviewer _	
Beacon(s)	"Target"
Tape Cassette	117
Comments:	

- 1. RV session run by COTR, SRI personnel not involved.
- 2. Remote viewer and interviewer blind as to target location and target activity of interest.
- 3. Pre- and post-session calibration experiments with Nat'l Geographic target material (Sea of Galilee area; St. Vincent Is., Windward Is., respectively) yielded good results, indicating with good probability that remote viewer "on-line" during viewing.
- 4. Remote viewer described experimental site, high-energy technology.

Date 8 Jun	ne 1981, 0859 hrs (Session 1); 9 June, 0854 hrs (Session 2)
Series	
Session No	
Target No.	J.S. #20
Target	
Remote Viewer	#002
Interviewer	H. Puthoff
Beacon(s)	CRV (Coordinate Remote Viewing)
Tape Cassette	118

- 1. Coordinate supplied to interviewer at beginning of Session 1.
- 2. Remote viewer and interviewer blind as to target location and target activity of interest.
- 3. Pre- and post-calibration experiments with Nat'l Geographic target materials yielded good results, indicating with good probability that remote viewer was "on-line" during viewings.*
- 4.

Session 1: Pre- Valdez, Alaska; Bora Bora; Port-Said; Post- Sitankai Session 2: Pre- Beachway, RI; Post- Mount Rainier.

Date 30 Ju	11y 1981; 0907 hrs (Session 3)	
Series		
Session No	3	
Target No	J.S. #20	
Target		
Remote Viewer	#002	
Interviewer	H. Puthoff	
Beacon(s)	CRV (Coordinate Remote Viewing)	
Tape Cassette	#119	
Comments:		

- 1. Continuation of scans carried out on 6/8/81, 6/9/81.
- 2. Remote viewer and interviewer blind as to target location and activity of interest.
- 3. Pre- and post-session calibration experiments with Nat'l. Geographic materials yielded good results (although post-session somewhat weaker), indicating with good probability that remote viewer was "on-line" during viewings, although not with great depth of contact.*

4.		

Pre-session calibration: Mt. Kilimanjaro, Aruba Island; Post-session calibration: Seattle, Washington.

SRI International

47

333 Ravenswood Ave. • Menlo Park, CA 94025 • (415) 326-6200 • Cable: SRI INTL MNP • TWX: 910-373-1246

Date 3 August 1981, 0815 hrs (Session 4)
Series
Session No. 4
Target No. J.S. #20
Target
Remote Viewer #002
Interviewer H. Puthoff
Beacon(s) CRV (Coordinate Remote Viewing)
Tape Cassette #120
Comments:
1. Continuation of scans carried out on 6/8/81, 6/9/81, 7/30/81.
 Remote viewer and interviewer blind as to target location and activity of interest.
3. Pre- and post-session calibration experiments with Nat'l. Geographic materials yielded good results, indicating with good probability that
remote viewer was "on-line" during viewings.*
* Pre-session calibrations: Antwerp, Belgium; Bora Bora Island
Post-session calibration: Erciyas Dagi (Mountain), Turkey.

SRI International

48

Date 4 August 1981, 0825 hrs (Session 3)	
Series	
Session No. 5	
Target No. J.S. #20	
Target	
Remote Viewer #002	
Interviewer H. Puthoff	
Beacon(s) CRV (Coordinate Remote Viewing)	
Tape Cassette #121	

- 1. Continuation of scans carried out on 6/8/81, 6/9/81, 7/30/81, 8/3/81.
- 2. Remote viewer and interviewer blind as to target location and activity of interest.
- 3. Pre-session calibration experiments with Nat'l. Geographic materials yielded good results; post-session calibration experiments yielded correct descriptions but weak interpretations, indicating viewer went somewhat "off-line" during overall sequence.*
- 4.

Post-session calibrations: Robinson Crusoe Island; Dubrovnik, Yugoslavia.

SRI International

Target	
Remote Viewe	r#002
Interviewer	H. Puthoff
Beacon(s)	CRV (Coordinate Remote Viewing)
Tape Cassett	e 123
-	

- 1. Coordinate supplied to interviewer Puthoff at session start
- 2. Remote viewer and interviewer blind as to target location and target activity of interest.
- 3. Pre-, mid-, and post-session calibration experiments with Nat'l.

 Geographic target material (Hong Kong; Mt. Hood; and Kotor, Yugoslavia, respectively) yielded good results.
- 4. Remote viewer describes complex of buildings, with site having to do with high-energy, high-technology activity.

Date 15	September 1981; 0858	hrs	
Series			
Session No.	1		
Target No	J.S. #22		
Target			
Remote Viewer	#009		
Interviewer _	H. Puthoff		
Beacon(s)	"Target"		,
Tape Cassette	124		

- l. Session monitored
- 2. Remote viewer, interviewer and monitor blind as to target location and target activity of interest.
- 3. Site accessed by abstract "Target," taken to correspond with a site chosen to by COTR and known only to him at time of session.
- 4. Pre-session calibration with Nat'l. Geographic target site (Dubrovnik, Yugoslavia) good, indicating good conditions going into session.
- Remote viewer described airfield location and associated buildings, including some interiors.

This is a terrible place for some reason. I am having words like med V: biological, research, human use, human guinea pigs rather, prison fac H:

Chemicals and gas, a biological warfare place. This is like a V:decompression chamber. Maybe those are contamination chambers. Oh dear, what did we find. Who gave this coordinate? I came across it seems to be five rather complex chambers in a very large hangar like building. They remind me of the decompression chamber that we saw down at that marine research base on Cataline. A decompression place where people went if they came up from diving too fast. A complex chamber made of reinforced steel and concrete and things and it has tanks. They have tanks of various kinds leading into them.

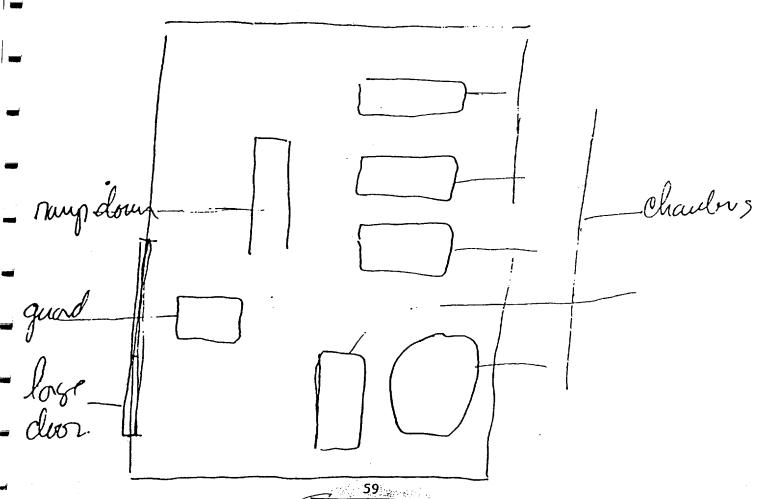

Chemeals & gasses Riological war fares.

ools: Mudondgas WWI -

*AOL - See previous page like decompression chambers in a lorge hangar-like building

Approved For Release 2000/08/07 CIA REP96-00788r001300280002-7

There is the smell of disinfectant and ultra violet lights, purple light, lavendar light, inside this large hangar like building. The floor seems wet. People wear boots, very large rubber boots. There seem to be inside stairs going down. This place is maybe 40 ft high at least. There are these chamber units there, but there are stairs and an elevator going down. And a ramp and lift forks, so this is underground too. It's funny, there seems to be windows on the outside, but there aren't any windows on the inside. Fake windows. I seem to see what looks like a guard cubicle because it has all glass around, it is inside the building. comparison to the other cold lavendar lights, it has yellow illumination in it. There are six men there. There is a big panel, it seems to be a voltage control panel for some sort of electronics system. Down the ramp are very long corridors. It looks like storage. There are signs everywhere. I can't read the characters but the phoenetics is sort of There are blinking red lights over some doors here and there. I think these are exit markers.

Approved For Release 2

-RDP96-00788r001300280002-7

V:

Outside the ground isn't flat, it is sort of like there are hills or artificially made mounds that sort of divide up this compound in a way. Buildings that look like barracks. A whole series of buildings that look like prefabricate boxes, that are sort of all stacked together. Water tank on the hill. Large tower I think and in the area there is an airstrip. It is about 2 miles to the NE I think. I am going to end there. I don't like this place.

At that Class A site there was a tall thing that I couldn't make out, I bet that that is a chimmney. I bet those are large furnaces.

INSTRUCTIONS TO ANALYSTS (U)

(U) The information provided as enclosure to this report was obtained in
response to a collection requirement provided by
This information was acquired from a new and potentially valuable source
Work is currently being pursued to determine the accuracy,
reliability, and improvement potential of this source. Your remarks and
attention to the evaluation sheet will be the basis for our assessment of this
new collection technique. Therefore, the effort you expend will greatly assist
us and will ultimately result in you receiving more data of increasing accuracy
and reliability.

- (U) While formulating your judgements concerning the data, the following comments concerning this new source of Information may be helpful.
- (U) Foremost, the data is likely to consist of a mixture of correct and incorrect elements. Specifically:
 - The <u>descriptive</u> elements are generally of higher reliability than <u>judgements or labels</u> as to what is being described (recreational swimming pool may be mistaken for water purification pools, an aircraft hull may be mistaken for a submarine hull, etc.). Therefore, seemingly appropriate descriptive elements should not be rejected because of mislabeling.
 - (2) The data often contain gaps (in a 3-building complex, for example, perhaps only two of the buildings may be described, and an airfield may be added that isn't there). Such gaps or additions should not be taken to mean that the rest of the data is necessarily inaccurate.

information packet to obtain an overall "flavor" of the response, reserving final judgement even in the face of certain errors, and then go back through for detailed analysis.

(U) If you have questions regarding the data you have received or on its evaluation please feel free to contact me at any time. Thank you.
